

Quasi-static delamination models for Kirchhoff-Love plates

C. Zanini, L. Freddi, R. Paroni, and T. Roubicek

The talk will address a quasistatic rate-independent brittle delamination problem and also an adhesive unilateral contact problem on a cylinder with a prescribed normally-positioned surface inside. By letting the thickness of the cylinder go to zero, we obtain two quasistatic rate-independent crack models with prescribed path for Kirchhoff-Love plates.
